

VEHICLE INTERCOMS

for

MPV & MOBILITY

Clear 'Hands Free' Communication Between the Driver and the Passengers.

Specifically designed for larger vehicles with no division between the driver and the rear.

The primary purpose of the intercom is to allow rear passengers to hear the driver speak. The driver is facing forwards, away from the passengers, and so it is hard for his voice to be heard. The passengers are facing towards the driver, and so less amplification is needed from the rear to the driver.

Wolfelec has many years experience designing and manufacturing intercoms for Taxi's and Ambulances and our products are recognised as the most rugged and reliable in the industry. Once installed they stay working and require almost zero maintenance.

Installation of the Intercom is straightforward and full instructions are provided. Anyone experienced with fitting a car radio should be competent to carry this out.

Special Needs:

If your passengers have speech or hearing impediments there are optional devices that may help them. These include hearing aid induction loops, rear gooseneck microphones, and plug in headsets.

Vehicle Converters

Kits can include all necessary components such as speakers, microphones, switches, and hardware but we also manufacture custom length intercom harnesses. Alternatively we will work with vehicle builders to match our intercom to their harness for fast and easy 'plug and play' installation on the production line.

We are absolutely thrilled with the intercom, thank you. It has improved our enjoyment of travelling enormously as we can now hold a conversation without screaming at each other.
Many thanks for your advice and concern.
